

## Workshop schedule for Microscale Thermophoresis (MST)

Presented by: Dr. Stefan Duhr, NanoTemper, Munich, Germany

Microscale Thermophoresis is a powerful new technology, which is based on a physical principle used for the first time in biomolecule analytics. It is unique compared to other technologies since it detects changes of charge, size and hydration shell of molecules directly in free solution. It has exceptionally low sample consumption and offers fast measurements, as well as the ability to measure close-to-native conditions: immobilization-free and in bioliquids of choice make it a valuable tool, even for the most challenging samples.

NanoTemper's unique technology is ideal for basic research applications providing the flexibility to measure a wide range of different samples, as well as for standardized pharmaceutical research applications. This workshop will demonstrate the technique with hands-on examples. An instrument will be available for review.
